

Trafox Superintend®

Residual Current
Monitoring System

Residual Current Monitoring System

VRE-08, VRE-16, VRE-32 and VRE-64 product family!

Contains Ethernet interface for monitoring and controlling the VRE device from anywhere using a web browser and Internet. New version v2.00 contains a Master mode and the possibility of changing the settings on the web interface.

Technical summary

Supply voltage	90-264 V 47-63 Hz	Channel CT testing	ON/OFF, ON by default
Power consumption	14,3 W	Alarm relay contact	one changeover contact, max. 8 A 250 VAC / 30 VDC
Measuring channels VRE-08/16/32/64	8/16/32/64 pcs	Warning relay contact	one changeover contact, max. 8 A 250 VAC / 30 VDC
Maximum length of the measuring cable	100 m	Operating temperature	0 ... +55 °C
Measuring range	0 mA - 20 A	Storage temperature	-20 ... +70 °C
Measuring accuracy		Humidity	< 95 %, non condensing
- closed transformer	±5 %, ±2 dgt	Installation	panel mounting (DIN 43700)
- split transformer	±10 %, ±2 dgt	Electrical safety standard	IEC 61010-1:2010 (3rd Edition)
Repeatability	±5 %, ±2 dgt	Complies with the following EMC standards	EN 61326-1 (2006), EN 61000-3-2 (2006), EN 61000-3-3 (1995) +A1(2001) +A2(2005)
Alarm range	5 mA - 10 A	RoHS	2002/95/EY
Alarm delay	0 - 95 s		
Warning level	OFF/1 - 100 % of alarm level

Predictive technology for

- Preventative maintenance
- Protection
- Data collection

Continuous monitoring of residual current has proved to be an effective method of maintaining preventative maintenance systems. The result of monitoring the electrical network is a more reliable and “cleaner” electrical system.

Continuously monitoring units detects faults and generates alarms for the following:

- insulation damage or degradation
- wiring errors
- neutral-to-ground faults
- connection of defective devices
- leakage currents insufficient to blow a fuse or to trip a circuit breaker.

Residual current is measured by a sensitive sum current transformer. Phase and neutral conductors of electrical systems go through the sum current transformer. If the electrical system has a separate grounding conductor, it has to stay outside the sum current transformer.

Only a small leakage current flows through the insulation impedance to ground when there is no fault in the electrical system. If a fault occurs, part of the current goes to the grounding conductor and the current leakage increases to a multiple value forming a so called fault current.

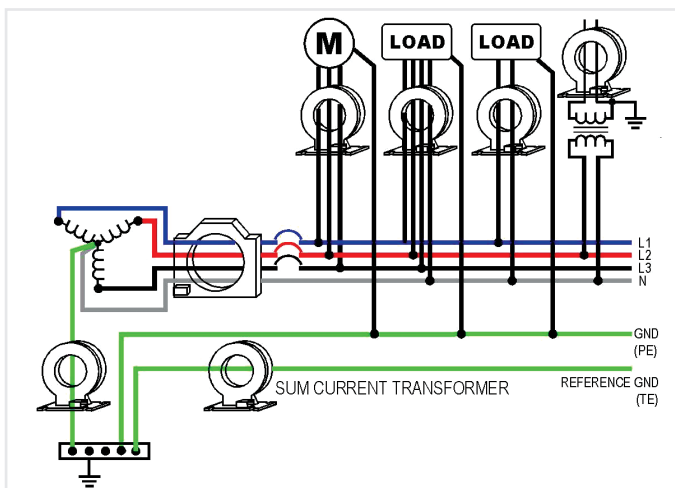

Measuring points

An independent alarm threshold setting and delay can be set to each measuring point. An alarm is received immediately from the measuring point when the fault occurs. Detecting the location of the fault is easy and fast.

The VRE-08, VRE-16, VRE-32 and VRE-64 devices also contain an alarm warning function. With it the ground faults can be found on earlier stage, when the fault current is rising but has not reached the unacceptable level yet. The warning signal (LED indicator and relay message) is generated, if the channel's fault current level exceeds the warning level set to the channel (1 – 100 % of the channel's alarm level).

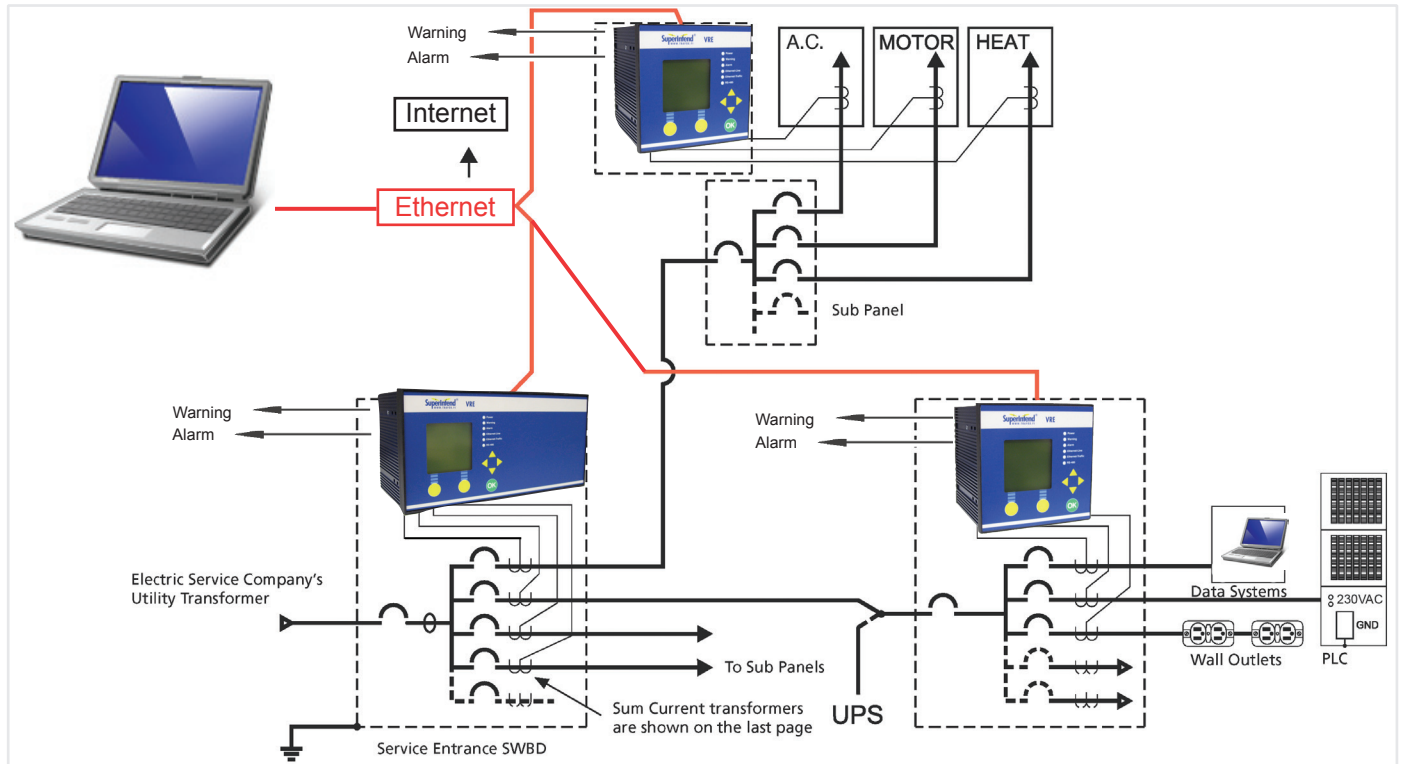

Isolated electrical system

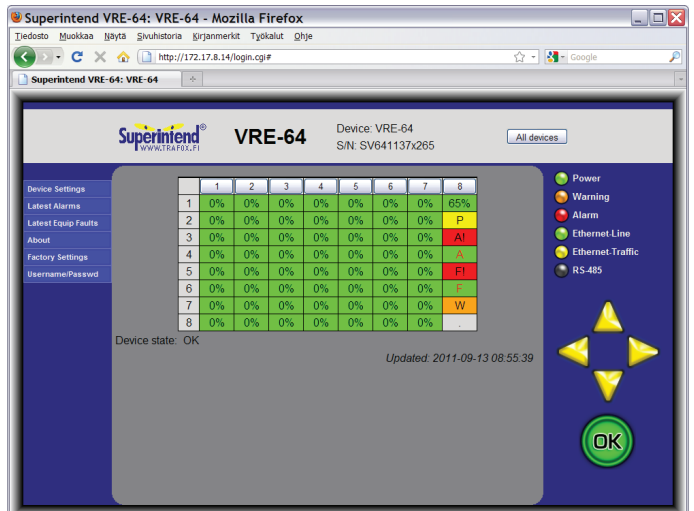

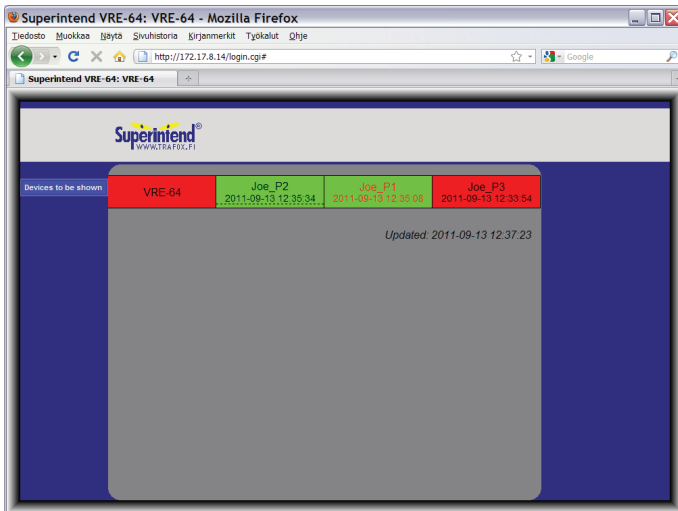

TT-electrical system

Remote/stand-alone monitoring system

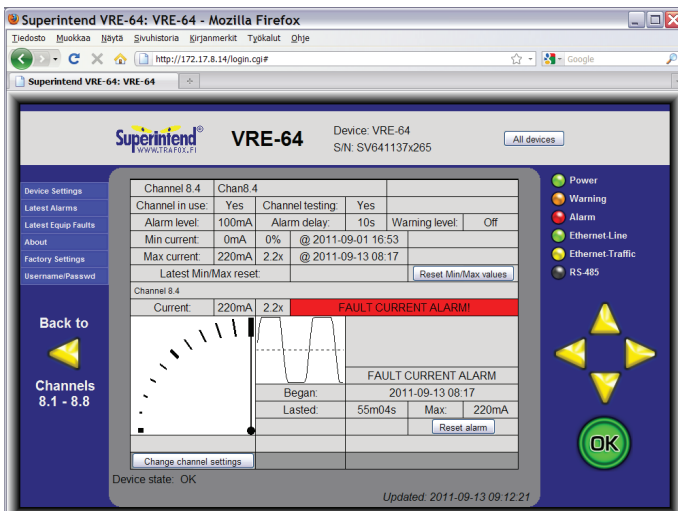

With a VRE device equipped with the Master functionality, you can see at one glance the status of totally 32 VRE devices at maximum. Via the Internet, you can control all your VRE devices from anywhere using any computer equipped with a web browser.

The colour of the device cell tells the alarm status of the device. You can view the channel-specific information of any device by clicking the device cell on the Master view.

On the main view of a VRE device you can see the status of all channels of the device. The colour of the channel cell tells the alarm status of the channel, so here you can see at one glance the channel which has caused the possible alarm.

Some detailed information of one channel is shown on the channel-specific view. In addition to the momentary fault current level, the channel view shows the fault current waveform, alarm status of the channel and minimum/maximum fault current history. Channel settings are shown and it is also possible to change them.

The list of the latest alarms and equipment faults can be viewed on the web interface. It is also possible to change the basic settings of the VRE device and restore some or all settings to the factory default values. Also username and passwords can be modified on the web interface.

Single channel Residual Current Monitoring System

VR-16

Use of VR-16 monitoring system

Ground fault protection can be used for equipment protection only - not for personal protection.

Technical summary

Digital display of current and set values

Measuring range:

Model VR-16 10mA-10A

Model VR-16/100 100mA-100A

Installation: DIN opening in panel boards

Flush mounting with mounting kit

DIN 35 rail

IP 54 (Nema 4) window for flush mounting

Automatic self-testing

The benefit of using earth leakage current monitoring system is having a better personal and fire safety. Insulation faults can be predicted and preventative maintenance can be done in time.

Residual current monitoring.

Also available a flush mounting kit for panel board installation. Weight 150g.

Model	Measuring range	Alarm settings	Alarm delay settings
VR16	10mA-10A	30mA, 100mA, 300mA, 500mA, 1A, 3A, 10A	0.1s, 0.5s, 1s, 3s, 5s, 10s
VR16/100	100mA-100A	300mA, 1A, 3A, 5A, 10A, 30A, 100A	0.1s, 0.5s, 1s, 3s, 5s, 10s

Supply voltage and power: 100 - 250V

Available also VR16/DC model with 24 VDC supply voltage

Relay contacts: 2 separate single pole double throw dry contacts max. 250VAC 5A
